

Effects of P-Mg Essence on the Pod Quality of Vegetable Soybean

S. T. Cheng¹

ABSTRACT

To increase the pod yield and quality of vegetable soybean, the experiment for foliar application of P-Mg Essence TM was carried out in the fall and spring crop seasons in 1987 and 1988, respectively. The yield of three-seed pods, and number of effective pods per 500 grams in the fall crop season of 1987, and yield of effective pods per hectare were significantly increased by the foliar application of P-Mg Essence.
